#### September 19th

#### **Fresh cows: fetching the cow and blood money**

Ryan Pralle, Assistant Professor in the School of Agriculture at the University of Wisconsin-Platteville will talk about two projects he is currently working on. The first topic will be on a novel blood panel developed that will predict high liver triglyceride status in multiparous cows as a proxy for fatty liver. His second topic will be on the impact of early lactation milking frequency (3x vs 6x) on multiparous dairy cow production and health from cows at the UW-Platteville farm utilizing Lely robotic milkers. He will discuss the differences in productivity, possibly nutrient partitioning, and surprising lack of habituation/training on the high frequency cows to high voluntary visits after they stopped fetching intensively.

#### **Silage specific corn hybrids for dairy cattle diets**

*Written by: Luiz Ferraretto*

Maximizing consumption of dry matter or increasing the energy density of the diet are key strategies for improving milk and milk protein yields. Upgrading the nutritional quality of corn silage through hybrid selection may benefit farmers via improvements in lactation performance. Table 1 summarizes the normal range of corn silage nutrient composition. Starch and fiber (presented as NDF) are the main components and primary sources of energy in corn silage. This article will discuss the pros and cons of silage-specific corn hybrids altering stalk (fiber) and kernel (starch) characteristics of corn plants.

**Table 1. Nutrient composition of corn silage<sup>1</sup>**
