Dairy Cow Stress and Strain: Impacts on Reproduction

Submitted by: Jackie McCarville, Heather Schlessner, and Ryan Sterry

Most dairy managers dream of the “anonymous” cow. Trouble-free in udder conformation and mobility; rarely, if ever, treated for health events; and breeds back year after year. She’s anonymous because, on a day-to-day basis, our only interaction with her is milking. Anonymous cows do not need to be handled or receive special attention. Dr. Matt Lucy at the University of Missouri posits that these anonymous cows can better handle the daily stressors they encounter. Why do cows that face a common challenge (**Stress**) respond differently to it (**Strain**), and how do managers capitalize on this? The short answer is genetics, but it isn’t that simple, and we will discuss it in this article.

Stress: a force that results in a biological response.

Strain: the animal’s response to that stress.

REDUCE STRESS → **MANAGE STRAIN** → **SELECT RESILIENT COWS**

When dealing with cattle, we must remember that they are a prey species and experience metabolic and behavioral changes in response to stress. Stressors can be broadly categorized as:

- Environmental
- Disease
- Production
- Nutritional
- Psychological
-

To demonstrate, we can look at an example of an environmental stressor: heat and humidity. The **stressor** (heat and humidity) is applied equally to all animals. The **strain**, however, is the individual animal’s response to the stressor. In this example, we can measure individual animal’s responses (strain) through elevated body temperature. This response can vary widely between animals, with different cows having different levels and rates of increased body temperature.
